

Minimum Roof Slope Requirements for Installation of WIP® Products

This Technical Bulletin provides guidance for best practices of roof slope design where Carlisle WIP Products underlayments are installed.

Carlisle WIP Products are self-adhering roofing underlayments which include WIP GRIP, WIP 100, WIP 100SG, WIP 250HT, WIP 300HT, and WIP 401LT.

As best practice, Carlisle WIP Products are recommended for any normal steep-slope roof system. However, these underlayments should not be used in a zero-slope or “flat” roof. Carlisle WIP Products are recommended in applications having a minimum 2/12 pitch. Refer to the technical data sheet for specific underlayment limitations and installation guidelines.
